## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1, 2, 9, and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Brewer et al, US Patent 4,947,859 in view of Reeves et al, US Patent 5,913,829. Brewer et al discloses an acoustic signal sensor for body sounds comprising an acoustoelectric transducer 16, and viscoelastic unit 15 whereby the transducer 16 is a piezoelectric member. Brewer does not disclose that the piezoelectric member tightly surrounds the lateral surface of the viscoelastic unit and that said unit engages tightly in its rear area to a hard back piece. Reeves discloses a sensor for capturing hear sounds which has a piezoelectric member 12 surrounding the lateral surface of the sensor unit. It would have been obvious to one of ordinary skill in the art at the time of invention to modify Brewer to have the transducer 16 surround the polymer unit 15, as taught by Reeves et al, for the purpose of having the transducer 16 directly contact the subject's body, thereby increasing the effectiveness of the auscultation reading. Furthermore, it was well known to have a sensor, as taught by Brewer, in an electronic stethoscope for the purpose of diagnosing patient health problems.

Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Brewer in view of Reeves as applied to claim 1 above, and further in view of Ota, US Patent 6,295,365. The combination of Brewer and Reeves does not specify that the acoustic transducer member is

constituted by a ceramic ring with a piezoelectric effect. However, it was well known, as evidenced by Ota, to use a ceramic material in the construction of an acoustic sensor for a stethoscope. Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to use the teachings of Ota to modify the combination of Brewer and Reeves to include a ceramic ring in the acoustic sensor.

***Allowable Subject Matter***

Claims 3-6, 8 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
